

Republic of Korea-Pacific Islands Climate Prediction Services Project Summary: March to May 2023 (MAM)

2023-02 Edition

Climate Outlook for March ~ August 2023

- The APCC ENSO Alert suggests "INACTIVE". During January 2023, negative sea surface temperature anomalies were observed over the tropical Pacific. The Niño3.4 index is expected to gradually increase from -0.2°C to 1.2°C during March–August 2023. As a result, the ENSO state is expected to change from neutral during March–May to El Niño during June – August 2023. El Niño intensity is expected to gradually increase from April – June to June – August 2023.
- Strongly enhanced probability for above normal temperatures is predicted for Micronesia, Melanesia, and Polynesia south of 15°S for March–August 2023. The equatorial region east of the Date Line is likely to experience near normal temperatures during March–May 2023 and a transition to above normal conditions during June–August 2023.
- Enhanced probability for above normal precipitation is predicted for Micronesia and Melanesia (excluding the equator) during March–May 2023, which is likely to decrease for Melanesia and be intensified for equatorial northern Polynesia during June–August 2023. Strongly enhanced probability for below normal precipitation is expected for off-equatorial southern Polynesia during the whole forecast period.
- Please see <https://apcc21.org/ser/outlook.do?lang=en> for more information.

Republic of Korea-Pacific Islands Climate Prediction Services Project

Important:

This publication is developed from information in PICASO and CLIK®, products of the Republic of Korea-Pacific Islands Climate Prediction Services Project (ROK-PI CliPS).

This resource is compiled to provide dynamical model data to support and complement information generated by Pacific Islands NMHS.

Contact your location Meteorology Service for site specific forecasts.

PICASO

PICASO (Pacific Island Countries Advanced Seasonal Outlook) is a PC-based seasonal prediction tool tailored for the Pacific Island countries jointly developed by APCC and SPREP through the ROK-PI CliPS project.

PICASO produces probabilistic forecasts of the seasonal mean rainfall of the given weather stations by customizing the data from the APCC dynamical seasonal prediction multi-model ensemble.

CLIK®

The rainfall and temperature forecasts are derived from a multi-model ensemble (MME) of all available Dynamical Models that are provided by WMO Global Producing Centers (GPCs) available on the Climate Services Toolkit for the Pacific (CLIK Pacific or CLIK®).

CLIK® is a product of the Republic of Korea-Pacific Islands Climate Prediction Services Project (ROK-PI CliPS).
